Grasslands & Savannas Neglected ecosystems? – Time to act

WWF Conference. 4th of June, 2019 in Berlin Magnus Haus, Kupfergraben 7, 10117 Berlin

Supported by:

based on a decision of the German Bundestag

Sustainable grassland management and the role of livestock:

- Successful examples of livestock production in harmony with nature.

Stephan H. Böhm, Gut Haidehof, German Savory Hub

A local perspective...

GUT HAIDEHOF

REGENERATIVE AGRARKULTUR

Why we farm the way we farm

Why we farm the way we farm

Ecological

We restore ecosystems and water cycle, increase biodiversity while drawing CO₂ out of the atmosphere.

Economic

We regenerate soil fertility and grow more grass. We decrease input costs while increasing carrying capacity and profits.

Health

Healthy soil leads to healthy plants and healthy animals. Having access to such nutritious food, our health as humans thrives.

Community

Based on good and profitable farming practices we re-build a thriving farming community and network.

Social

Applying a decisionmaking framework lets us cope with the complexities of managing land, livestock and people.

Communication

Honest and open communication is the basis for collaboration and trust. We share our knowledge and experiences.

... embedded in a global perspective.

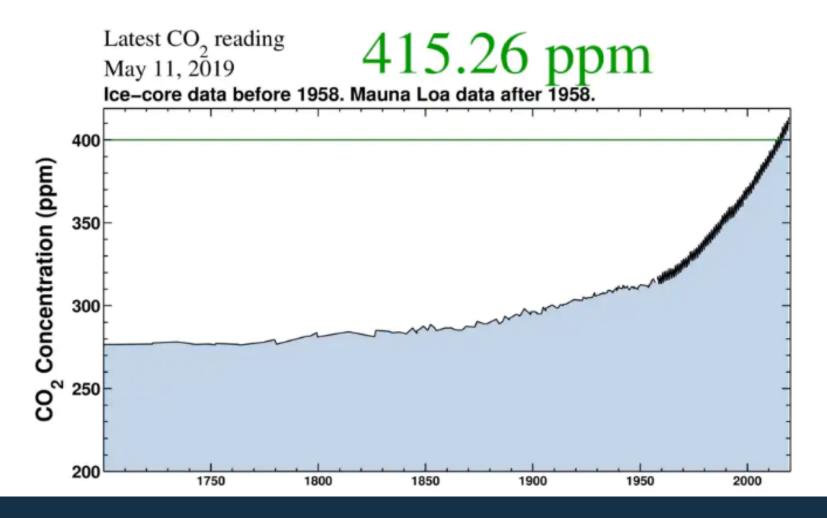

The Washington Post

Democracy Dies in Darkness

May 14, 2019

(29 °C)

It was 84 degrees near the Arctic Ocean this weekend as carbon dioxide hit its highest level in human history

PROBLEM

Reductionist thinking, industrialized agriculture, and extractive capitalism have wreaked havoc on our global grasslands, which represent 1/3 of Earth's land surface.

405 **YEARS** PPM

70%

Amount of Earth's grasslands facing desertification

Global cost of poor land use by 2050

UN FAO's estimate of time left to farm at current rate of soil degradation

Current level of atmospheric CO₂, up from pre-industrial level of 280ppm.

"Climate change, biodiversity loss and desertification are three sides of the same coin."

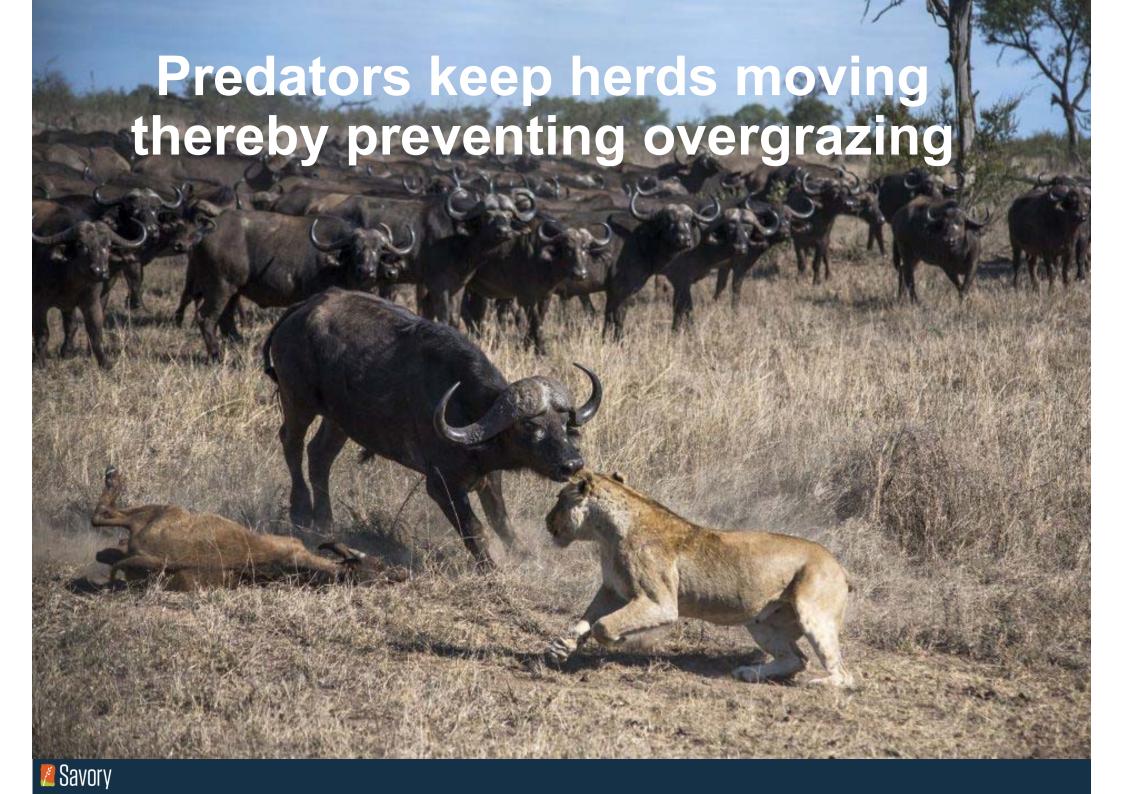

Allan Savory

Allan Savory's discoveries:

Land rest leads to desertification **Savory**

Animals can be used as tools

The impact of grazing

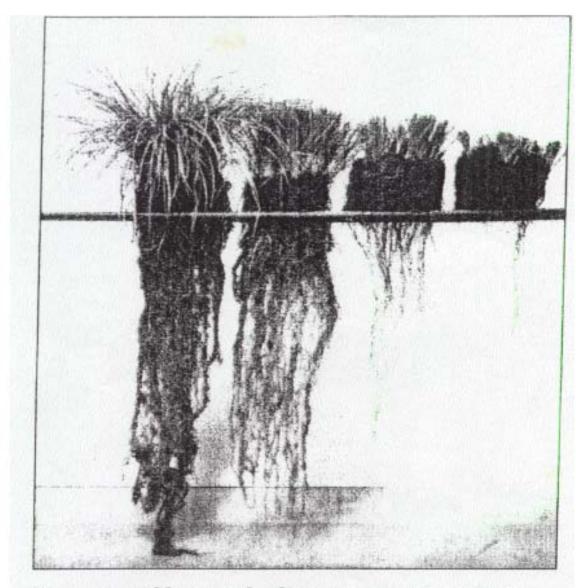

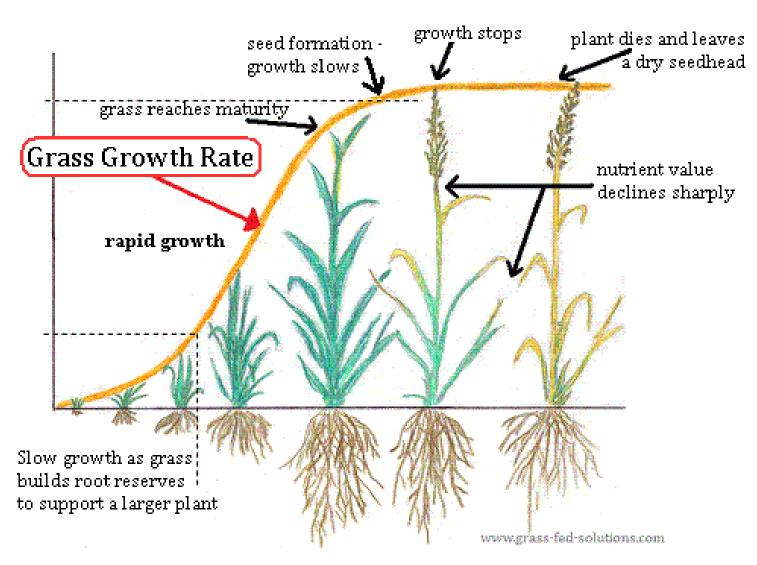

Fig. 1. Effect of clipping intensity on roots (from Agriculture and AgriFood Canada publication 1589).

Grass growth rates vary greatly depending on plant maturity.

How we graze:

40 years of overgazing by horses lead to:

- Poor sandy soil with a rating of 15/100 points
- Neither soil life nor humus
- Couch grass-dominated pastures
- Few species and legumes
- Strong water influence on former marshland

The objective: regenerate our grasslands

We plan our grazing

The implementation

June 01, 2019

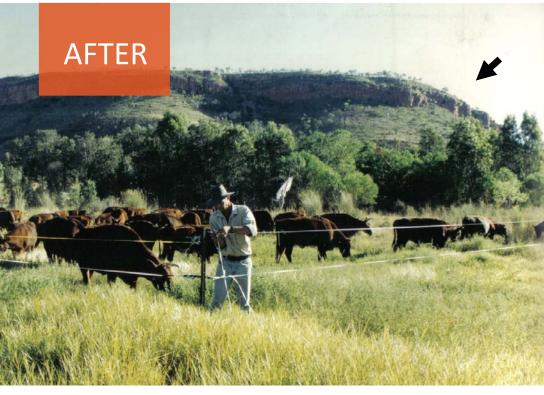

Differences between the grazing regimes:

- **Set stocking:** livestock are allowed to stay on the same land for a long time, mostly for the entire season. There is no management of their behavior.
- Rotational grazing: livestock are moved from one pasture to the next. Only
 moves are considered, not their timing. Rotations are set and neither growth
 rate nor recovery time of plants are taken into account.
- Mob grazing: high stock density, short duration grazing with high numbers of animals bunched together to increase animal impact. Moved are as frequent as 3 times per day. The recovery time of plants is not planned.
- Holistic Planned Grazing: practice of charting grazing moves that consider the time that a plant is exposed to a grazing animal so that its recovery is planned. Wildlife, human and other needs influence the grazing plan.

RESULTS

Dharma Lea Dairy

Paul and Phyllis Van Amburgh purchased Dharma Lea and its dairy cattle in 2007. They began with rotational grazing, without the use of inorganic fertilizers, and supplemented with corn and grain until 2008 when they made the decision to go 100% grass-fed.

In 2013, after attending a Holistic Management workshop, they decided to switch from rotational grazing to Holistic Management, and began Holistic Planned Grazing in 2015. They achieved the following results:

Sharon Springs, NY, USA

120

INCREASE IN GRAZING DAYS PER YFAR 68%

INCREASE IN GRASS HARVESTED 41%

GROSS MARGIN, UP FROM PREVIOUS 3% 10%

INCREASE IN MILK SOLIDS

A True Carbon Sink that accumulates and stores carbon in the soil

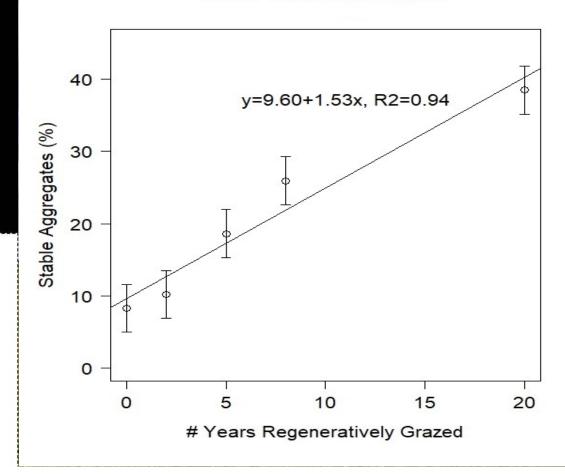

Carbon Footprint Evaluation of Regenerative Grazing At White Oak Pastures

Life Cycle Assessment Mariko Thorbecke & Jon Dettling 02/25/19

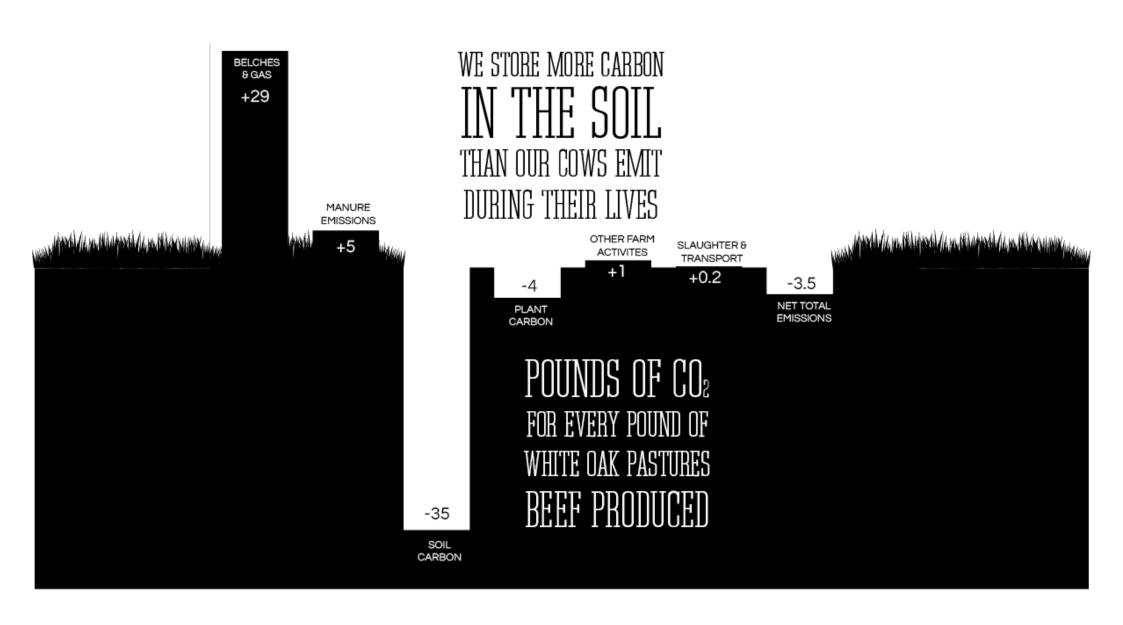

CASE STUDY
